

NOTA / NOTE

Cimex hirundinis Lamarck, 1816 (Hemiptera: Cimicidae) in Portugal

Abstract: The swallow bug, *Cimex hirundinis* Lamarck, 1816 (Hemiptera, Cimicidae), is recorded from a specific locality in mainland Portugal for the first time, following a 1966 record from the country without further details. The new record significantly increases the known Iberian distribution of the species.

Key words: Hemiptera, Cimicidae, *Cimex hirundinis*, first locality, Portugal.

Resumen: *Cimex hirundinis* Lamarck, 1816 (Hemiptera: Cimicidae), nueva especie para Portugal. Se cita por primera vez *Cimex hirundinis* Lamarck, 1816 (Hemiptera: Cimicidae) de una localidad concreta en Portugal continental, tras un registro sin más detalle publicado en 1966. El nuevo registro amplía significativamente la distribución ibérica conocida de la especie.

Palabras clave: Hemiptera, Cimicidae, *Cimex hirundinis*, primera localidad, Portugal.

Introduction

The swallow bug, *Cimex hirundinis* Lamarck, 1816 (Hemiptera, Cimicidae), is a hematophagous true bug species described by LAMARCK (1816), presumably from Europe, as it was reportedly observed by Latreille on a swallow's nest. Until recently, *Cimex hirundinis* was classified in the genus *Oeciacus* Stål, 1873, which was synonymized with *Cimex* Linnaeus, 1758 by BALVÍN et al. (2015) based on molecular evidence.

The swallow bug is associated with at least 20 bird species (TRILAR et al., 1997) and presents a wide global distribution that includes Europe (from the Iberian Peninsula to Great Britain, in the west, and from Scandinavia and Russia to the Balkans, in the east), northern Africa (Algeria, Morocco, and Tunisia), and Asia (from the Near and Middle East to eastern Siberia) (PÉRICART, 1996). The known Iberian distribution of *C. hirundinis* includes the Spanish provinces of Barcelona (SÁNCHEZ, 1920), Huelva (HILL, 1992), Badajoz (DE LOPE et al., 1993), and Zaragoza (TANCO, 2018) (Map 1).

As for Portugal, the literature survey conducted yielded only two references to the occurrence of *C. hirundinis* in the Portuguese mainland: USINGER (1966) and PÉRICART (1996). In the former - a worldwide monograph of the family Cimicidae - USINGER (1966) first recorded the species from Portugal, albeit without any details ["In the British Museum (Nat. Hist.) spirit collection are specimens from Switzerland, Portugal, and Algeria."]. In the latter, while studying the western Palaearctic cimicid fauna, PÉRICART (1996) mentioned the possible presence of *C. hirundinis* in Portugal by including "PO?" in the list of European countries of occurrence. As a result, we consider the record presented below to be the first from a specific locality in Portugal, thus confirming its presence in the country.

Material examined

Porto district: Vila Nova de Gaia municipality: Laborim de Baixo, on the ceiling inside an apartment (41.105718, -8.603911; MGRS: 29TNF3350; 127 m a.s.l.), 05/01/2020 (1 ♂, Manuel José Silva & J.M. Grosso-Silva leg., MHNC-UP col.: MHNCUP/ART/41071).

Discussion

The record presented herein not only provides the first locality for the swallow bug in mainland Portugal, as stated above, but it also greatly expands the known Iberian range of the species as illustrated in Map 1.

According to PÉRICART (1972), swallow bugs hibernate on birds' nests both as adults and as nymphs (not feeding during the absence of the hosts) and may, under certain circumstances, leave the nest and enter houses. The collecting conditions in Laborim de Baixo are consistent with this behaviour, as the specimen was collected in the early winter on the second floor of a residential building, in a room whose only window stands a few metres away from a house martin nest, *Delichon urbica* (Linnaeus, 1758).

Acknowledgements

I am much indebted to Dr. Marta Goula (Barcelona) for her help in gaining access to an old and elusive reference. I also want to thank Maria João Fonseca, Ondřej Balvín, and Torsten van der Heyden for their useful suggestions on different aspects of the manuscript.
